

StoryTime: MVP Blueprint v0.4

Turning remote *family calls* into *private*,
replayable *memory chapters*.

Product Requirements & System Architecture

The AI is the stage crew, not the star

The Stage Crew

The Star

Dad is away, but the child can replay the exact moment they laughed, invented a dragon, and finished the adventure together.

The saved memory is not just the story output—it is the shared moment. We capture the voices, laughter, choices, and reactions, preserving the child's imagination unfolding with someone they love.

Defining the boundaries of the MVP

	StoryTime MVP	Out of Scope / Non-Goals
Primary Function	Guided, parent-mediated connection	General video calling or complex 3D worlds
AI Role	Assisting stage crew for story beats	Open-ended, child-facing chatbot or voice cloning
Network Scope	Strictly private family vault	Public child profiles, stranger discovery, or social sharing
Final Output	A private digital memory chapter	Ephemeral, unrecorded calls or physical printed books

The Launch Segment

The atomic unit of value: One completed chapter

Strategic Note: Campaigns may exist as lightweight metadata, but the MVP must ruthlessly optimise for chapter completion and replay over complex long-running mechanics.

The MVP User Journey

The mechanics of storytelling: The Baton System

The Story Director AI workflow

MVP Technical Architecture Stack

Critical Architectural Rule: MVP must use raw-track capture plus background FFmpeg/media worker for async composition. **LiveKit RoomComposite** is explicitly excluded due to scaling risk and high compute cost.

The Chapter Composition Ledger

Every critical story and UI event is logged to an immutable, timestamped ledger.

The Async Process

Instead of rendering live video, the async compositor uses this ledger to stitch raw media tracks, generated scenes, captions, and baton states together in the background.

Tracked Events (Examples)

Setup choices selected -> Seed locked -> Turn submitted -> Image ready -> Baton passed -> Recording stopped.

Ecosystem safety and privacy rings

Child Experience: Silent AI fallbacks (replaces unsafe story beats or images with safe placeholders without exposing technical/frightening language); no public profiles; no ads.

Parental Control: Explicit recording notices; verifiable parental consent before any collection; end-to-end deletion controls and retention limits.

System Infrastructure: Zero model training on family media by default; processor inventory; strict audit logs for deletion and export actions.

Non-negotiable MVP release gates

Usage controls and monetisation strategy

Future Paid Tier: Increased storage/credits; standard MP4 downloads; premium remastering; cloud backup; storybook exports.

Free Beta Constraints: Limited weekly Adventure Adventure Credits; strict Memory Vault storage caps.

Cost Tracking Mandate

The system must track granular unit costs:

LLM calls,
image-generation calls,
transcription minutes,
replay bandwidth,
and background
composition cost.
